

(a) textbook ABC-PMC, schematic: one update per generation shown: generation $t \rightarrow t+1$, after 135 simulations

P_{t+1} : the N kept, weighted; the rejected are discarded

barrier: q_{t+1} needs the complete P_{t+1}

(b) generation-free (ours): one update per arrival shown: the update after 84 evaluations

θ^* to a free worker; ρ^* arrives later, among other workers' results: append $(\theta^*, \rho^*, \epsilon_n, w^*)$

bootstrap, fewer than k particles: prior draw, $w^* = 1$, no bandwidth stored

every panel: the same unit prior box
